1. In what ways are you able to make the UI better than in Lab 3?

My Lab 4 UI hasn't changed from Lab 3. Because I started using jQuery and Ajax from Lab 3. I avoid using JSP like in tutorial because I think decoupling front and back-end is better. The JSP technology, on the other hand, mix front and back-end. This is really important when you have multiple front-ends (like web, Android, IOS), because it lets you have one unified back-end. Also one advantage of Ajax is you don't have to re-load whole page but you just update a small part of it so the response time is much short and the app feels much faster.
